

Local Security Principles

Lab 1: Sudo

Create a new user called **user1** using the **useradd** command:

```
sudo useradd user1
```

Add this user to the **sudo** configuration file. Switch to this new user and make sure you can execute root level commands. Since this new account will not have an assigned password, to switch to it, use:

```
sudo su user1
```

Lab 2: Password Aging

With the newly created user (**user1**) from the previous exercise, look at the password aging for the user. Modify the expiration date for the user and check to see what has changed.

When you are finished and wish to delete the newly created account, use the **userdel** command:

```
sudo userdel user1
```
